Introduction and Overview

The South Carolina Marine Game Fish Tagging Program is in its 34th year with the Marine Resources Division of the South Carolina Department of Natural Resources. This year (2008) marks the fourth year that the program has operated under a new format, which limits participation to 225 trained volunteer taggers. By limiting the number of participants, the program is able to operate more efficiently and provide meaningful interactions between participants and program staff. This ultimately increases public awareness of conservation efforts involved in the stewardship of South Carolina's natural resources. Furthermore, providing feedback in the form of a detailed catch report to both the angler that tags a fish and to the angler that reports a tag recovery helps to reinforce the benefits of practicing catch and release. The program is constantly evolving in order to meet the changing data needs required for managing marine fisheries resources and ensure that all participants realize the benefits of their contributions.

The principal funding source for the tagging program comes from revenue generated by the sale of the South Carolina Saltwater Recreational Fishing License. An annual funding proposal is submitted each year to the Saltwater Recreational Fishery Advisory Committee outlining the program objectives, goals, and budget. The committee reviews the proposal, discusses the proposed budget, and provides recommendations. Funding for the upcoming year is awarded on July 1. Additional funding comes from the occasional donations made by individuals or fishing clubs which help to further offset program costs.

The program is administered by SCDNR staff (Robert Wiggers, Ernest Muhammad, and Ryan Yaden), who divide their time between the tagging program and various other Marine Division programs for which they are involved.

Select marine finfish species are targeted for tag and release based on two criteria. First, they must contribute significantly to South Carolina's marine recreational fisheries. Second, specific data gaps have been identified for a particular species in regards to seasonal movements, habitat requirements, length frequency characterization, release mortality or growth data.

The following report is a summary of tagging activity for 2007.

Target Species

Target species for 2007 included all species of billfish, tuna, sharks, snapper-grouper and flounder. Other specific species include black drum, bluefish, cobia, king mackerel, red drum (over 18 inches), sheepshead, tarpon, and gray trout (weakfish). Special emphasis was placed on tagging weakfish, and this focused effort will continue. **We have added Jack Crevalle to the targeted species list for 2008.**

Angler Awards and Overall Participation

The tagging program presents a Conservation Award to those anglers that tag and release a minimum of 30 eligible fish within a calendar year. In addition to receiving credit for a typical tag and release, anglers also receive credit for a tag and release if they catch a fish that already has a tag (either yellow recreational or orange "DJ") and release the fish with the tag left intact. **Species (other than weakfish) less than 12 inches in total length, non-target species, and red drum less than 18 inches are not counted towards the conservation award, although data is still utilized.**

In 2007, 23 anglers qualified for conservation awards (Table 1).

The top tagger for 2007 was Mr. John Dunphy with 414 fish tagged and released. The majority of John's fish were tagged off Fripp Island in Beaufort County. His top three species tagged were red drum (119), weakfish (117), and requiem sharks (89). In addition, John made a significant contribution by utilizing t-bar tags to focus additional tagging effort on weakfish as part of a separate study.

The second top tagger spot went to Capt. Michael Waller with a total of 280 fish tagged and released. His top three tagged fish were requiem sharks (141), sheepshead (83), and red drum (23). The majority of Mike's tagging effort was concentrated in the Kiawah River and adjacent creeks. This is the second year in a row that Mike has been the number two tagger.

The programs' number three spot was occupied by Gary DenBraven. Gary tagged a total of 267 fish in 2007, all of which were tagged and released off the Surfside Pier in Myrtle Beach. His top three fish tagged were requiem sharks (149), weakfish (35) and bluefish (29). Gary is a fixture on the Surfside Pier and has been part of the programs' core tagging group for almost two decades.

Out of the 220 trained taggers, 47% tagged at least one fish (Table 2). However, only 39% of the 3,440 tags issued to program participants in 2007 have yet to be received back in the form of tag cards detailing the initial tag event.

Program Operation and Management

The key to success for the public tagging program is keeping the number of participants at a manageable number. This allows for a much easier means in which to communicate and provide feedback to program participants.

Anglers wishing to participate in the program are required to attend a workshop before being issued tags and equipment. Once certified, anglers are not required to attend another workshop but must renew their registration each year in order to continue receiving tags; however, experienced taggers are encouraged to attend another workshop. This provides an opportunity to share information and suggestions gained from actual experience tagging and releasing different species.

Anglers that express an interest in participating, after the workshop series has been completed, are added to a mailing list to be notified regarding the schedule for the upcoming year. Letters are typically sent out a month prior to the first scheduled workshop, and anglers must pre-register for the workshop they plan to attend. Workshops focus on training anglers the proper techniques used in handling, tagging, venting, and releasing marine game fish in addition to providing an overview of the programs' tag and recapture database. The two hour workshop is divided into two parts; a presentation, followed by "hands-on" tagging where participants have the opportunity to practice tagging on dead fish. The practice tagging proves invaluable in helping anglers to hone their tagging technique before placing a tag in a live fish.

Tagging Equipment

Yellow nylon dart tags (Figure 1) have proven to have good tag retention and are relatively easy to apply. Three sizes of tags are used depending on the species and size of fish being tagged. The smallest tags measure 9.5 cm (3.75 in.) and are used on fish between 12 and 27 inches. The next size measures 14.5 cm (5.75 in.) and is used on fish over 27 inches. The largest tag is a stainless steel harpoon tag specifically for tagging sharks and billfish. Unlike dart tags, the harpoon tag is designed to embed in the muscle of the fish as opposed to locking between spines. Applicators for the nylon dart tags are stainless canulas imbedded in a wooden dowel. A stainless slotted tip is provided to anglers for use with the harpoon tag along with instructions for building a tag stick.

The reasons for utilizing these tag types are primarily the low cost and ease of application requiring a minimum amount of instruction.

Each tag has a corresponding postage paid information card (Figure 2) where anglers report the necessary information about the tag event. Size information, primarily in the form of **total length measurements**, is important in determining length frequency characterization of discards, and anglers are strongly encouraged to record accurate measurements of the fish they are tagging.

2007 Tag and Recapture Data

Compared to 2006 (2,926 fish tagged), 2007 showed a slight decrease in tagging activity with 2,797 fish being tagged and released (Table 3). There were 301 recaptures reported in 2007 (Table 4) of which 75% were re-released with the tag still intact. The practice of releasing tagged fish with the tag still intact is strongly encouraged and heavily promoted as it allows for obtaining additional data points. Multiple recaptures increase the level of precision in identifying patterns of movement among different species as well as growth rates.

Out of the 301 reported recaptures there were 54 that had no associated initial tag information.

Black Drum

There were 146 black drum tagged in 2007, which is more than twice the number tagged in 2006. Of those, 57% were caught and tagged within 3 miles of the South Carolina coast (State waters) mostly in and around the Georgetown jetties. Forty-three percent were tagged offshore on reefs. Fish ranged in size from 12 to 32 inches with an average size of 17.1 inches.

Nineteen (19) black drum recaptures were reported in 2007, 15 of which were re-released. Again this year, there was no significant movement documented, and the majority (89%) had been tagged in 2007. This represents an annual recapture rate of 12% which is a significant decrease over last year's annual recapture rate of 26%.

Black Sea Bass

In 2007, 118 black sea bass were tagged and released. We have seen yearly increases in tagging activity for black sea bass since 2005 (10) and 2006 (98). Ninety-six percent of these tagged fish were caught offshore (beyond 3 miles) of South Carolina. The average size of a tagged fish was 12.2 inches.

Fourteen (14) black sea bass recaptures were reported. There was no significant movement of fish from the original tagging site. Out of 14 recaptures, all were re-released except for 2 that were retained. Two fish were at liberty for over 230 days.

Bluefish

Sixty-five (65) bluefish (average size of 13 inches) were tagged in 2007 with no reported recaptures. The overall recapture rate for bluefish in this program is about 2%. Past tagging activity in the spring off of South Carolina tends to result in tag recaptures primarily to the north, with documented movement as far north as Maryland. Bluefish tagged later in the year have shown a marked southerly movement and have been recaptured as far south as Stuart, Florida.

Cobia

Sixty-two (62) cobia were tagged and released in 2007. Thirty-four (55%) of these were tagged in the Broad River during May and June. Eleven (11) fish were tagged and released off Florida's east coast, and eight (8) fish were tagged on artificial reefs off South Carolina and Georgia. The average size tagged and released was 31 inches.

There were 17 cobia recaptured in 2007, 58% of which were retained. Six (6) fish were at liberty for more than 300 days. The majority of recaptures occurred within close proximity of the initial tagging site; however, one fish, a 30" specimen recaptured off Cape Lookout, NC on 5/27/2007, was initially tagged off Surfside Beach on 7/1/2006 (est. distance 201 miles) and had grown just over 10 inches.

Another cobia (35-inch FL) recaptured on July 28, 2007 on the General Gordon Wreck had been at liberty for 414 days. The fish was originally tagged on June 9, 2006 in Port Royal Sound and was measured at 27 inches fork length (est. 12.5 lbs). This is another recapture that supports the long term spawning site fidelity that has been consistently documented for cobia in Port Royal Sound, the Broad River, and adjacent nearshore waters.

Flounder

One-hundred forty-six (146) flounder were tagged in 2007. More than half (53%) were not identified to species on the tag information card, but of those that were, 15 were identified as summer flounder and 54 identified as southern flounder. All three species of *paralichtid* flounders (southern, summer and Gulf) are found in South Carolina with the southern being the most commonly encountered of the three. Based on this fact, it is believed that the majority of species unidentified were southern flounder. Tagging activity for flounder occurred primarily in the coastal areas north of Georgetown around the following locations (# tagged): Hog Inlet (52), Murrells Inlet (36) and Surfside Pier (16). The average size of flounder tagged and released was around 13 inches.

Overall, nine (9) flounder were recaptured in 2007, of which 6 were retained. Recaptures occurred in the same area as the initial tagging event. The maximum days at large (DAL) was documented at 90 days. Since 1989 the tagging program has documented 424 flounder recaptures (8% overall recapture rate) with an average DAL of about three months and the longest DAL documented at 1,834 days.

King Mackerel

Between May and August of 2007, 39 king mackerel were tagged and released. All but one (tagged off Florida's east coast) were tagged off South Carolina, and of those, eight were tagged and released near designated artificial reefs. The average size of fish tagged was 34 inches with an average weight of 12 pounds. There were no reported recaptures for 2007 which is typical for a species with a historically low recapture rate (around 2%).

Red Drum

Tagging effort of red drum during 2007 was similar to that seen in years past. One thousand sixty four (1,064) fish were tagged, ranging in size from 10 inches to 48 inches. Red drum made up 38% of the total number of fish tagged in 2007, with most of the tagging effort focusing in and around the Charleston area.

In the southern coastal region (Beaufort, Colleton counties), the primary areas where red drum were tagged included (number tagged): Trenchard's Inlet/ Skull Creek (69), Broad Creek/ Old House Creek (49), Chechessee River (35), and Fripp Dry Dock (19). In the central coastal region (Charleston, Berkley counties): Wando River (108), Charleston Harbor and adjacent areas (122), and Ashley River and Cooper River (19). Top tagging

locations in the northern coastal region (Georgetown, Horry counties) include Winyah Bay and adjacent areas (50) and the Sampit River (4).

Red drum are truly indicative of the program's conservation focused directives. During 2007, 323 fish (32%) were tagged and released that were within the legal slot limit **(which on 1 July 2007 went to 3 fish between 15 and 23 inches)** and could have potentially been retained. These recaptures provide proof to anglers of the benefits of practicing catch and release.

During 2007 there were 193 reported recaptures of red drum with 94% being re-released. Seventeen (17) were recaptured twice and two (2) were recaptured three times in the same year.

In most cases, red drum are recaptured within close proximity of the initial tag location which supports strong site fidelity of sub-adult fish.

Billfish

Due to potential tag induced mortality, consistently low recapture rates (less than 1%), and the benefits of using satellite tags (although extremely expensive at around \$3,000 apiece), there has been little promotional effort from the MGFTP in encouraging billfish tagging with archival tags. As a result only 35 billfish were tagged during 2007. Twenty-four (24) sailfish, 8 blue marlin, and 3 white marlin.

Two (2) sailfish were recaptured in 2007. The first, a 60" fish, was recaptured on January 27, 2007 off Miami, Florida and was initially tagged on July 24, 2007 off Charleston. (917 DAL; re-released without tag). The second was recaptured off Cuba on May 22, 2007 and was initially tagged off Charleston on July 17, 2005 (674 DAL; retained).

Sharks

Anglers are encouraged to tag and release sharks provided it can be done safely and the tagger can make a positive identification of the shark they plan to tag. For this reason, it is recommended that certified taggers spend some time referencing shark identification guides, or contact program staff in order to become more familiar with identifying species characteristics.

Five hundred twenty six (526) sharks, encompassing a variety of species, were tagged and released during 2007. The majority (72%) were small coastal species (Atlantic sharpnose and bonnetheads), which is not surprising since these are the most frequently encountered species by recreational anglers. The top three large coastal species tagged and released were (# tagged): Blacktip (29), lemon (15), and sandbar (10).

As was the case in 2006, Atlantic sharpnose made up 36% of the total number of sharks tagged and released in 2007; Primary tagging sites (number tagged) included: Surfside Pier (89), St. Helena Sound (36), and Stono Inlet (12). Three (3) Atlantic sharpnose were

recaptured which represents a 2% annual recapture rate. All were recaptured in the same general vicinity within a week of the initial tagging event.

There were 188 bonnethead sharks tagged in 2007. Ninety nine (99) of these were tagged in the Kiawah River around Mullet Hall and Haulover Creek. Average size of tagged bonnetheads was around 37 inches. There were six (6) recaptures (all re-released), one of which was at large for over three weeks and moved from the Kiawah River to Capt. Sam's Inlet.

Sixty-seven (67) dogfish (1 spiny, 66 smooth) were tagged and released. Sixty-one (61) smooth dogfish were tagged off of Surfside Pier, all of which were tagged by Gary DenBraven. There were 4 dogfish recaptured (3 smooth, 1 spiny). One smooth dogfish recaptured off Oregon Inlet, NC on February 5, 2007 was initially tagged off Surfside Pier on April 20, 2006. (291 DAL; est. distance traveled: 283 miles).

Twenty nine (29) blacktip sharks were tagged in 2007, more than half (65%) of which were tagged by John Dunphy. The most active tag locations included (# tagged): St. Helena Sound (7), Hilton Head Reef (7), and the Fripp Island Dry Dock (5).

Sheepshead

Sheepshead continue to become an increasingly popular species targeted by recreational anglers, and during 2007 participants tagged and released one hundred seventy one (171) fish. The average size tagged was 13.9 inches. Tagging activity occurred primarily from September through December. Top tagging locations (number tagged) included: Kiawah River (87), Charleston Jetties (40), and the Wando River (8).

Seventeen (17) sheepshead were reported recaptured during 2007, 35% of which had been tagged within the same year. This represents an annual recapture rate of 3% which is considerably lower than the programs' cumulative rate which is around 12%. The average days at large was 160 days with the longest time at large 970 days (about 2 ½ years). An examination of recapture locations versus initial tag locations reveals the seasonal movement patterns of fish moving from inshore to slightly offshore (mostly nearshore artificial reefs) as water temperature cools in the late Fall.

Multiple recaptures of the same fish from the same location indicate strong site fidelity as evident from the following recapture: Initially tagged on September 1 near a dock on the Kiawah River, the fish was recaptured at the same dock on September 4th, the 14th, and again on the 17th, before being re-released with the tag still intact.

Snapper-Grouper

Tagging effort on snapper-grouper complex species is primarily focused on undersized fish, and these species typically represent less than 7% of the total number of fish tagged as part of the program. During 2007, 131 snapper-grouper complex species (excluding black sea bass, sheepshead, and spadefish) were tagged and released. The top species

tagged (number tagged) (average size) were scamp (24) (19 inches TL), red snapper (28) (17.19 inches TL), red porgy (16) (12.15 inches TL), and gag grouper (16) (16.54 inches TL).

Overall, scamp grouper was the most commonly recaptured species with five reported recaptures. One scamp tagged on 7/2/2006 (P. Godbout) was recaptured on 4/22/2007 (290 DAL).

As with most snapper-grouper species that are tagged as part of this project, it is difficult to document movement since location information for both the initial tag and recapture event is often generalized (partial coordinates). Anglers may feel that by providing specific location information they are compromising their fishing spot. Regardless, the tag and subsequent recapture of species caught in deep water can provide some insight into post release survival rates.

Spadefish

There were only 12 spadefish tagged in 2007 most of which were tagged during June and July. More than half (66%) were caught off of the Surfside Pier and ranged in size from 8 to 15 inches with an average size of 12.17 inches.

Three recaptures were reported, all which had been initially tagged in 2007 (25% annual recapture rate) with average days at large of 50 days. All fish were recaptured at the same site where they were originally tagged which is a typical pattern documented with spadefish.

Weakfish

Figure 1. A tagged weakfish, *Cynoscion regalis*.

In order to gain a better understanding of the weakfish fishery off South Carolina and document the correlation to that of the overall Atlantic coast weakfish stock, a focused tag and release effort was undertaken in 2005. Through 2007, 688 weakfish have been tagged and released.

Weakfish continue to be a priority species for the public tagging program and fish are tagged by both certified taggers and program staff using either dart or t-bar tags. In an effort to get more fish tagged, several certified taggers were supplied with a tagging gun and t-bar tags and recorded pertinent information on data sheets. Overall, during 2007, 119 weakfish were tagged with t-bar tags and 123 were tagged with small nylon dart tags. This is somewhat less than what was tagged and released in 2006 (413), and by most accounts it appears the fish were not as abundant as they had been in years past.

Overall, the average size of weakfish tagged and released ($n=242$) was 14.3 inches with a size range between 10 and 24 inches. This larger average size as compared to last year (12.9 inches) is a result of more fish being tagged and released in the southern coastal region where we have typically seen average catches of slightly larger fish.

Tagging locations (number tagged) for weakfish, based on the total tagged, were: Fripp Dry Dock (91), Surfside Beach (82), Charleston Nearshore Reef (25), Savannah Wreck (17), Edisto Nearshore Reef (10), Edisto 40' Reef (4), Georgetown Nearshore (3), Kiawah River (3), Wando River (2), Charleston Harbor/Jetties (2), Lowcountry Anglers Reef (1), Trenchard's Inlet (1), and Hog Inlet (1).

Only one weakfish was recaptured during 2007. John Dunphy recaptured a weakfish he had tagged six days earlier on the Fripp Dry Dock wreck. The 20-inch fish, which had been tagged with a small dart tag on 11/20/2007, was recaptured at the same location and was re-released with the tag still intact.

T-bar tags were inserted using a tagging gun (Avery Dennison Swiftach®) shown in Figure 3. This is an extremely efficient tool for tagging fish quickly and is more "fish friendly" than the dart applicator, but at a cost of about \$43 per gun is cost prohibitive for a program operating with a limited budget.

Acknowledgements

Although there were no workshops held during 2007, staff would like to thank all volunteers that attended workshops in 2005 and 2006 and became "certified taggers". We appreciate the time that you have taken to help out with this project.

Thanks to all anglers that took the time to report the recapture of a tagged fish. The cooperation of the angling public is a vital component to the success of any tag and release study and we greatly appreciate this contribution.

Thanks to Bobby, Linda, and Robert Conklin who donated funds on behalf of Mr. Gene Hilton. Gene was a dedicated conservationist and a good friend who regrettably passed away in 2007.

Thanks to all the individuals who donated funds on behalf of Mr. John Fred Lillemoen, another friend and active conservationist who passed away in April 2007.

Thanks to Al Oswald and the members of The Saltwater Sports Club of James Island for their donation in 2007 and their consistent support of the MGFTP.

Table 3. Species tagged and released during 2007.

Species	# Tagged and Released
ATLANTIC SPADEFISH	12
BLACK DRUM	146
BLACK SEA BASS	118
BLUEFISH	65
COBIA	62
KING MACKEREL	39
RED DRUM	1064
SHEEPSHEAD	171
SPANISH MACKEREL	19
WEAKFISH	123 *(plus 119 w/ t-bars)
Flounder	
FLOUNDER (SPECIES NOT SPECIFIED)	77
FLOUNDER, SOUTHERN	54
FLOUNDER, SUMMER	15
Billfish	
BLUE MARLIN	8
SAILFISH	24
WHITE MARLIN	3
Sharks	
SPINY DOGFISH	1
SMOOTH DOGFISH	66
SHARK (SPECIES UNKNOWN))	6
ATLANTIC SHARPNOSE	192
BLACKTIP	29
BONNETHEAD	188
BULL	6
DUSKY	2
FINETOOTH	2
LEMON	15
SANDBAR	10
SCALLOPED HAMMERHEAD	1
SPINNER	3
TIGER	5
Snapper-Grouper	
ALMACO JACK	1
AMBERJACK	14
GAG GROUPE	16
GROUPE (SPECIES NOT SPECIFIED)	2
D GROUPE	6
RED PORGY	16
RED SNAPPER	28
ROCK SEA BASS	1
SCAMP	24
SNAPPER (SPECIES NOT SPECIFIED)	4
SPOTTAIL PINFISH	1
TRIGGERFISH	3
VERMILION SNAPPER	11
WHITE GRUNT	3
YELLOWMOUTH GROUPE	1
"Other Species"	
ATLANTIC BONITO	2
BARRACUDA	2
CREVALLE, JACK	4
DOLPHIN	90
LADYFISH	3
SPOTTED SEATROUT	30
TARPON	3

Table 4. Species recaptured during 2007.

Species	# Recaptured & Retained	# Recaptured & Released	Total
ATLANTIC SPADEFISH	1	2	3
BLACK DRUM	4	15	19
